

Energy saving **SOLAR** **STREET** **LIGHTING SYSTEM**

The Energy saving solar street lighting system is a self-sufficient, independent lighting system that eliminates the need to construct buried electrical supply trunks that are typical in conventional street lighting systems. It provides night illumination and security for places too costly to set up cabled lightings.

ADVANTAGES of cost effective LED lighting for streets, crossings, parking areas, gardens and public areas in comparison with conventional sodium lamps:

- ▲ Completely autonomous from external power supplies.
- ▲ Automatic On / Off function controlled by integral daylight light sensor.
- ▲ Over 10 year LED lamp life.
- ▲ Long life PV modules with 20 year production capacity.
- ▲ LED lamps retain luminosity for their full life span
- ▲ Zero power supply cost.
- ▲ Substantial reductions in CO₂ emissions.
